

Having a healthier bird

We all know the old adage that you are what you eat. We also know that the same is true for our pets; the better quality the food we feed to our cats and dogs, the fewer health problems, fewer vet visits, and the happier the pet. And yet we still have a tendency to continue to feed our pet birds the same old diet that we always have.

While seed has long been considered the standard for birds, there have been some major advances in diets and understanding a bird's nutritional needs. Seeds are very high in fat and lacking in vitamins and minerals. Black sunflower seeds, found in many bird seed mixes, are not only lacking vitamin A but will drain this important nutrient from your bird's body. Add to it that most birds are picky eaters and will pick out their favorite pieces and you have a recipe for a very unbalanced and unhealthy diet – and an unhealthy bird, too.

Nutritional deficiencies in birds are hard to diagnose and build up until symptoms show. They can begin with nasal discharge, dull and lackluster feathers, and low energy levels. Over time, it can lead to respiratory infections, blindness, trembling, seizures, paralysis, and death. The high fat content of seeds can lead to a disorder called fatty liver disease.

So how do we prevent this? Begin by offering a better alternative: pellets!

Pellets have the advantage of each bite being the same, nutritionally, with enough variety in color and shape to give them the fun of picking and choosing.

Our favorite brands of pelleted bird food:

ZuPreem: Formulated with fresh ground fruit for a taste and aroma birds love. ZuPreem has five fun shapes and colors to allow your bird to forage naturally while still getting a balanced diet with 21 vitamins and minerals. They use natural preservatives instead of chemicals to keep their food fresh.

Top's Parrot food: This healthy and wholesome parrot food is made with real food, no fillers, processed as little as possible to keep the nutrition intact. They use only the highest quality naturally clean, ecologically and

sustainably grown ingredients. Their suppliers are very carefully chosen companies, which grow ecologically responsible. Check out their [site for more information](#).

Goldenfeast: While this isn't a pelleted food, we still love it because of its wide range of fresh ingredients. These amazing foods are all natural approach to avian nutrition incorporates delicious ingredients, such as dehydrated fruits and vegetables, whole grains, seeds and nuts, superfoods, legumes, spices and herbs. They have a wide range of formulas and recipes, for every sized bird and small animals.

Introducing new foods:

Switching your bird's diet can be tricky, and major dietary changes should be discussed with your avian vet. Birds can be quite addicted to their seeds, like kids can be addicted to chocolate. While birds can resist change, there are some tricks that you can do transition them to a healthier diet.

- Some birds can switch over when their owner mixes it in gradually increasing amounts with their seed.
- Feed birds at their natural eating times: morning and afternoon. This keeps them in their natural rhythm and they'll be more willing to try new foods.
- Feed where your bird would naturally eat: Larger birds eat high in the trees, so place the new food in a dish up high. Rearranging their cage can help, as it excites them with the sense of the new. Smaller birds like cockatiels, budgies, and other small birds forage on the ground; take advantage of this by placing the need pellet on white paper in the bottom of the cage. Try putting the food on a mirror, as they'll often eat more readily with a "flock mate"
- Mix pellets with shredded newspaper or very small toys, like wooden buttons. This may help mimic normal foraging behavior.
- Offer the new food as a treat for a reward.
- Grind the pelleted diet in a blender, add some water, and mix some millet (or other favorite food) into this mash. Your parrot will have to go through the mash to get his favored food. This works well with smaller species such as budgies, lovebirds and cockatiels. Remove the mash after several hours to prevent spoilage.
- Some birds want to join the flock (you) in eating and will try the foods you like. Some have had success switching their birds to a pelleted diet by pretending to eat the pellets, and really enjoying them, and then offering it to their bird.

Cockatiel foraging in the wild

When changing a bird's diet, monitoring their droppings is important. Placing antibacterial bird cage liners on the bottom of the cage can allow you to see the form, composition, and size of droppings. Any decrease or imbalances can imply that your bird is not eating enough, and might mean that your bird needs to go back on

seeds for a short time. Weighing a bird before and during a diet change will allow you to monitor their food intake, also.

Other things you can feed your bird

A bland and monotonous diet is no fun for anyone, especially our pets! So mix it up by offering a lot of variety and choices for your birds.

The key to optimal parrot health is to provide a varied and balanced diet.

Seeds can be offered, in small amounts, with pellets and fresh fruits and vegetables as the main part of the mix. A great way to offer seeds is by sprouting them first. This process utilizes the seed's natural enzymes to unlock their full nutritional value. Most can be sprouted by placing between damp paper towels.

Most things you eat can be given to a bird, but avoid avocados in all its forms, as it is very toxic. Dark leafy greens, broccoli florets, bell peppers, peas, berries, apples, bananas, and oranges are just a few of the fresh foods that birds love. Try various foods to learn what fruits your bird likes, as everyone has their favorites. And if they don't like something the first time,

continue to offer it to them – like kids, it can take them a while to realize how much they like a particular food. Have fun offering new foods, and remember, since they want to join the flock, if you enjoy these foods in front of them, they'll be more likely to enjoy them, too. Check out our article, [Your Herbivore and You](#), for more ideas on fruits and veggies you can offer your feathered friend.

You can offer protein in small amounts in the form of scrambled eggs and cheese. Whole grain pastas and breads can be offered as treats. Keep the salts, fats, and sugars to a minimum, and avoid caffeine and alcohol; their bodies are small and their metabolism is fast, and they cannot handle these items.

Feeding a balanced diet for a healthy bird can be easy and fun. Sharing your food, seeing them get excited when you walk in with your plate knowing that dinner is coming is great. More importantly, feeding a balanced diet is vital to keeping your feathered friend happy, healthy, and with you for as long as possible.

Happy feeding!
